Managing multiple channels with multiple events does not need to be complex. Etere Multichannel Editor provides easy management, update, and monitoring of schedules across various channels and efficiently meets all your programming needs. It allows you to control and simultaneously monitor all channels on a single platform. You can access the software tools with one click to insert events, search for events, crawl events, and replace occurrences over multiple channels.

Etere Multichannel Editor provides a simple interface designed with quick access in mind. Select the program to open the Etere Executive Editor interface to access, edit, and update schedules. From the Executive Editor interface, the operator can instantly manage the daily schedule, insert events, move events, delete occurrences and publish changes to the automation schedule.

You can send a command from the same interface to Etere STMan to indicate a crawl request on a preset device. It displays a crawl text, and users can edit the information, for example, insert breaking news. You can also create and insert new secondary events, such as logos, script files, or scheduled event information. Users can select the station with which the secondary event should be associated.

Etere Multichannel Editor displays the event titles, duration, and a low-resolution preview of all events. Users can prioritize monitoring events that are more crucial than others. In addition, they can configure the scheduled preview to display the essential information.

The interface displays two types of event details views:

- Go to On-Air Event: This view allows you to see the on-air events
- Go to hh:ss:ss:ff: This view allows you to see all events at a selected time

Additionally, Etere Multichannel Editor offers an alert feature that notifies the user before the end of an event and before the next event starts. Each event status comes with labels of different colours for easy reference. Etere allows you to easily view and change the schedule of multiple channels to meet the demands of a fast-moving mediascape. Etere eliminates the need to switch between multiple interfaces and platforms to ensure higher operational efficiency and a better way of working.

Key Features

- ☐ View and monitor multiple channels and events simultaneously
- ☐ Easy management of multiple channels with seamless integration of Etere Executive Scheduling
- ☐ Insert events with a single click across various channels
- ☐ Display all event titles, event duration, and low-resolution preview
- ☐ Send last-minute crawls across multiple channels
- ☐ Search for an event and replace it over multiple channels with either a single event or a series of events
- ☐ Enables a more efficient operation
- ☐ Remote control panel for each station with a countdown timer that displays the time left to the next scheduled commercial break during the broadcast program and the time left to the end of the break during commercials

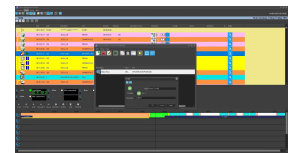

Fast Edits and Schedule Management

Etere Multichannel Editor provides a tight integration with Etere Executive Scheduling to manage quick edits and updates to the schedule from a single interface. Get the most from your programming with a full menu of integrated features to manage the daily broadcast schedule of multiple channels, including the insertion, movement, and deletion of events.

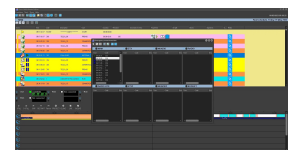

Create and Insert Secondary Events

Etere Multichannel Editor integrates seamlessly with Etere STMan to allow you to create new secondary events and send graphics, script files, and scheduled event information to the schedule. You can also send a command from the same interface to Etere STMan to execute the crawl script on a preset device. With this feature, it is possible to send a crawl text to update the information about an urgent event, for example, a breaking news announcement. You may also send a pass-thru (a type of secondary event) to send custom hexadecimal commands to any device, for example, a logo generator, subtitler, crawl generator, or router.

Emergency Event Insertion

The emergency event insertion enables the easy insertion of events into a specific position within the automation schedule and across multiple stations. It is important when changes are needed before the program goes on air. Without the need to crawl between applications, you can easily and quickly manage changes on the fly.

Remote Control Panel with Countdown Display

Etere Multichannel Editor also features a remote control panel display that is an essential feature of the playout. It allows the operator to have control of the playout. During programming, the remote control counts down the time to the next scheduled commercial break, whereas, during breaks, it counts down the time to the end.
