Etere Ecosystem

Step up your game with Etere's integration with S3 object archive on premises and on cloud. With cloud computing, you do not need to make large upfront investments in hardware. Instead, you are empowered with the freedom to choose the type and size of computing resources needed for your business and to access as many resources as needed almost instantly. Etere's tight integration with any S3 provider allows you to access your cloud or on premises storage directly, without the use of third party tools, drivers or software.

Setting up directories within Etere servers is easy with the option to customise multiple levels of user permissions or to set up a virtual directory available to all users. In addition, you can back up your data seamlessly in the cloud servers without latency or changes in the file quality. Not only that, Etere MD5 Checksum enables the generation and verification of the security file hash of media files associated to assets each time a media file is moved from one location to another. This prevents data corruptions or modifications to the file.

Etere systems are designed to promote connectivity and collaboration across distributed work environments. With the seamless integration, you are able to build an agile, flexible and intelligent architecture within a secure server in the cloud.
